

# **METHOD AND APPARATUS FOR RUBBING ALIGNMENT FILMS**

## **ABSTRACT**

5

A method for rubbing alignment films and an apparatus for processing the same are introduced. The method includes a step of providing a glass substrate coated by an alignment film and further having a visible region and an invisible region, a step of moving the glass substrate along a predetermined direction, and a step of rubbing the alignment film by an  
10 inversed roller with cloth on a surface thereof along an in-stream direction the same as the predetermined direction while the glass substrate is moving. By reverse rolling upon the alignment film, chips rubbed off the alignment film can be made not to hard contact with the alignment film on the visible  
15 region which has been rubbed by the cloth.
